.gitignore

After adding a README file, create a file titled PRIVATE.txt. In this file, place your name and PID. Once this is done, create a **.gitignore** file in the root of your repository and add the path to this PRIVATE.txt file (just the name of the file if PRIVATE.txt is in the root).

Under the 'Source Control' tab, stage the change to the file and add an appropriate commit message.

Before committing and pushing the change, take a screenshot of the staged commit, commit message, and current branch as a deliverable.

Part 3. Using Markdown

Create a new file called **index.md**. This is where you'll create your User Page, which should include content that introduces who you are as a programmer and as a person. Your User Page must be made with Markdown as described in the [GitHub User Page introduction above](#). For this assignment, your page must include the following:

- Pictures
- Links
- All other core Markdown constructs in [GitHub Flavored Markdown](#)
 - The core constructs being Headings, Styling text, Quoting text, Quoting code, Links, Section links, Relative links, Lists, and Task lists

Once you are finished, **publish your web page** through Github Pages - [instructions here](#). Include the URL to the published site in your README.md file.

OPTIONAL:

If you find yourself wanting to go above and beyond, here are some things you can add:

- A Github Pages theme
- Custom domain name for this page

Submit to Canvas:

- **Link to your GitHub Repository.** Inside your repo, make sure you have:
 - A folder called **screenshots** in your root directory with
 - Screenshot of command line git transactions
 - Screenshot of staged commit in VS Code
 - ...

.gitignore - Lab1 - Visual Studio Code
